May, 2001

1.0 INTRODUCTION

This report presents the results of groundwater sampling performed at the French Limited Superfund site, Crosby, Texas, for the 1st half of 2001. Aquifer measurements and sampling were completed in February, 2001.

Analytical results of the February, 2001, sampling are tabulated in Appendix A, including historic results since the shutdown of active remedial operations in December, 1995, and QAQC summary.

The February, 2001, water level and chemical concentration figures are shown in Appendix B.

2.0 PROGRESS MONITORING

Groundwater measurements and sampling were performed by Remedial Operations Group, Inc., (ROG), on February 6, 7, 8, 9, 12, 13, and 14, 2000. Measurements and sampling were performed in general accordance with Table 12.1, "Progress Monitoring Wells (1996-2005)", of the approved site closure plan¹.

Locations of wells used for sampling and water level monitoring are shown in Figures 2-1 through 2-3. These figures also show the area where the S1 and INT units are not separated by the C1 clay aquitard. The area of this "C1 window", where the C1 clay unit is absent, is taken from *Evaluation of Stratigraphic Controls on DNAPL Migration*².

Data management and QA/QC were performed by ROG. Analytical results were tabulated by ROG (Appendix A). Table 2-1 summarizes the analytical results for all wells. Appendix C contains the concentration trend graphs for the wells highlighted in Table 2-1.

2.1 Concentration > MCL

Groundwater samples from the wells with concentrations at or exceeding MCL's are presented in Table 2-2 for February, 2001.

2.2 Residual Nitrate

Residual nitrate exceeded 0.5 mg/L-N at 10 wells.

2.3 pH

Field pH values at nearly all wells were within the range 6.0-8.0, which is conducive to intrinsic bioremedial activity. Field pH values falling outside this range were 9.54 at INT-118 and 8.69 at INT-144 for July, 2000.

¹ Southwestern Environmental Consulting, Inc. January, 1996. *Site Closure Plan, French Limited Project, Crosby, Texas*.

² Applied Hydrology Associates, Inc. September, 1995. *Evaluation of Stratigraphic Controls on DNAPL Migration*.

Table 2-1
French Ltd. Progress Evaluation

Well Name	Comments
FLTG-013	1,1-Dichloroethane concentration @ 12ppb; Low levels reported sporadically since 1997.
FLTG-014	1,1-Dichloroethane concentration @ 5 ppb; First detected concentration reported. All other chlorinated compounds not detected.
INT-022	Vinyl chloride reported for second consecutive sampling event. (3ppb July '00 and 2ppb February '01).
INT-026	Benzene concentration @ 290ppb; No significant changes since Feb. '98.
INT-059-P-2	Reported values consistent with previous sampling events - no issues.
INT-060-P-3	All VOCs ND in February 2001. No issues.
INT-101	Reported values consistent with previous sampling events - no issues.
INT-106	Reported values consistent with previous sampling events - no issues.
INT-108	All VOCs ND in February 2001. No issues.
INT-118	All VOCs ND in February 2001. No issues.
INT-120	Chlorinated chemical concentrations continue downward trend since January 1999.
INT-123	All VOC concentrations detected in February 2001 reported at < 10ppb.
INT-127	Reported values consistent with previous sampling events - no issues.
INT-130R	Chlorinated compounds reported at high levels - no significant change since 1998.
INT-130RS	Reported values consistent with previous sampling events - no issues.
INT-134	Trending downward since 1998.
INT-135	All VOCs ND in February 2001. No issues.
INT-144	Vinyl Chloride detected @ 7ppb. Reported values consistent with previous sampling events.
INT-214	All VOCs ND in February 2001. No issues.
INT-217	Reported chlorinated compounds and benzene concentrations trending downward since April 1998.
INT-233	Chlorinated compounds ND in February 2001.
S1-031	All VOCs ND in February 2001. No issues.
S1-033	All VOCs ND in February 2001. No issues.
S1-051-P-3	Benzene decreased from 23ppb (July '00) to 10ppb (February '01).
S1-106A	Only trace amounts (less than 5 ppb) of chlorinated compounds detected.
S1-106R	Only a trace amount of benzene detected (5 ppb).
S1-108A	All VOCs ND in February 2001. No issues.
S1-111	Metals only well; Arsenic detected for 3 rd consecutive sampling event.
S1-118	All VOCs ND in February 2001. No issues.
S1-121	Reported values consistent with previous sampling events - no issues.
S1-123	Chlorinated compounds reported at high levels - no significant change since mid-1998.
S1-131	Reported values consistent with previous sampling events - benzene <50ppb since mid-1998.
S1-135	All VOCs ND in February 2001. No issues.

Bold print indicates wells with potential significant data trends - Concentration trend graphs were prepared for these wells (see Appendix)

Table 2-2
February, 2001, Concentrations

Well Name	Compound	Flag	Conc	Units	GW Criteria
INT-026	1,2-Dichloroethane		17	ug/L	5
	Benzene	D	210	ug/L	5
	Vinyl Chloride	<	5	ug/L	2

S1-123	Vinyl Chloride		28	ug/L	2
	1,2-Dichloroethane		84,000	ug/L	5
	Acetone	<	5,000	ug/L	3,500
	Benzene	<	5,000	ug/L	5
	Toluene	<	5,000	ug/L	1,000
	Vinyl Chloride	J	2,000	ug/L	2
S1-131	Benzene		22	ug/L	5
S1-135	Arsenic		92	ug/L	50

2.4 Contour Maps

Contour maps for water level, nitrate, dissolved oxygen (DO), total organic carbon (TOC), benzene, 1,2-dichloroethane (1,2-DCA), vinyl chloride and affected groundwater for the S1 and INT units in February, 2001, are presented in Figures 2-4 through 2-17 in Appendix B and discussed in Section 2.4.1. through Section 2.4.8. Contours are inferred from, the February, 2001, sampling results at progress monitoring wells, results of previous quarterly sampling at wells which are now plugged, and monitoring data obtained during active operations (between January, 1992, and December, 1995). Therefore, the contours presented are not based solely on the data shown on the contour maps, but incorporate judgement based on four years of historic monitoring data at a significantly wider well network. Former wells are shown on the chemical plume maps.

2.4.1 Water Levels

The water level measurements in February, 2001, were used to develop the respective groundwater contours and flow direction maps.

Water levels for the post-operational phase tend to reflect short-term, localized influences. Short-term rainfall events and beaver activity in the area affect the water level in the South Pond and other surface water bodies, which act as localized recharge or discharge areas depending on recent rainfall relative to average. The normal maximum level for the South Pond appears to be controlled by a downstream beaver dam. The South Pond was near the normal maximum level during the February, 2001, sampling event.

The S1 and INT water level maps indicate that significant downward leakage from the S1 unit to the INT unit occurs in a localized area south of the west end of the former lagoon, where the C1 clay is absent ("C1 window"). In this area, the average hydraulic gradient in the S1 unit is northeast towards the C1 window, whereas the average hydraulic gradient in the INT unit is to the southwest, away from the C1 window. This trend has been consistent since active remediation ended.

The other consistent feature is the low hydraulic gradient south of the former lagoon and east of the C1 window. In both the S1 and INT units, the gradient is generally to the southeast, away from the clay window. Overall, it appears that the cutoff wall has created stagnant groundwater flow conditions in the area south of the former lagoon.

Three sets of paired S1 unit monitoring wells track head differences across the cutoff wall, which enclose an active phytoremediation area. The well pairs are P-6/P-5; S1-119/S1-121; and S1-126/S1-64. The first well of each pair is inside the cutoff wall; the second well is outside. Head differences are shown in Figure 2-4. In February, 2001, hydraulic gradients were generally outward. It is planned that phytoremediation will eventually reverse this head difference. The sheet pile cut-off wall continues to be effective in controlling migration.

2.4.2 Nitrate

Nitrate contour maps for February, 2001, are presented in Figures 2-6 and 2-7. There was little change over the last 6 months in the S1 unit and most of the INT unit. This is consistent with the slow movement of groundwater over much of the area south of the steel sheetpile cutoff wall (see Section 2.5.1).

2.4.3 Dissolved Oxygen

Dissolved oxygen contour maps for February, 2001, are presented in Figures 2-8 and 2-9. Elevated DO concentrations in wells in both units reflect residual DO from the oxygen addition program. The area of elevated DO, and the maximum DO concentrations, have both decreased significantly in both units from the post-injection high in July, 1998. This may indicate use by aerobic bacteria to break down site chemicals.

2.4.4 Total Organic Carbon

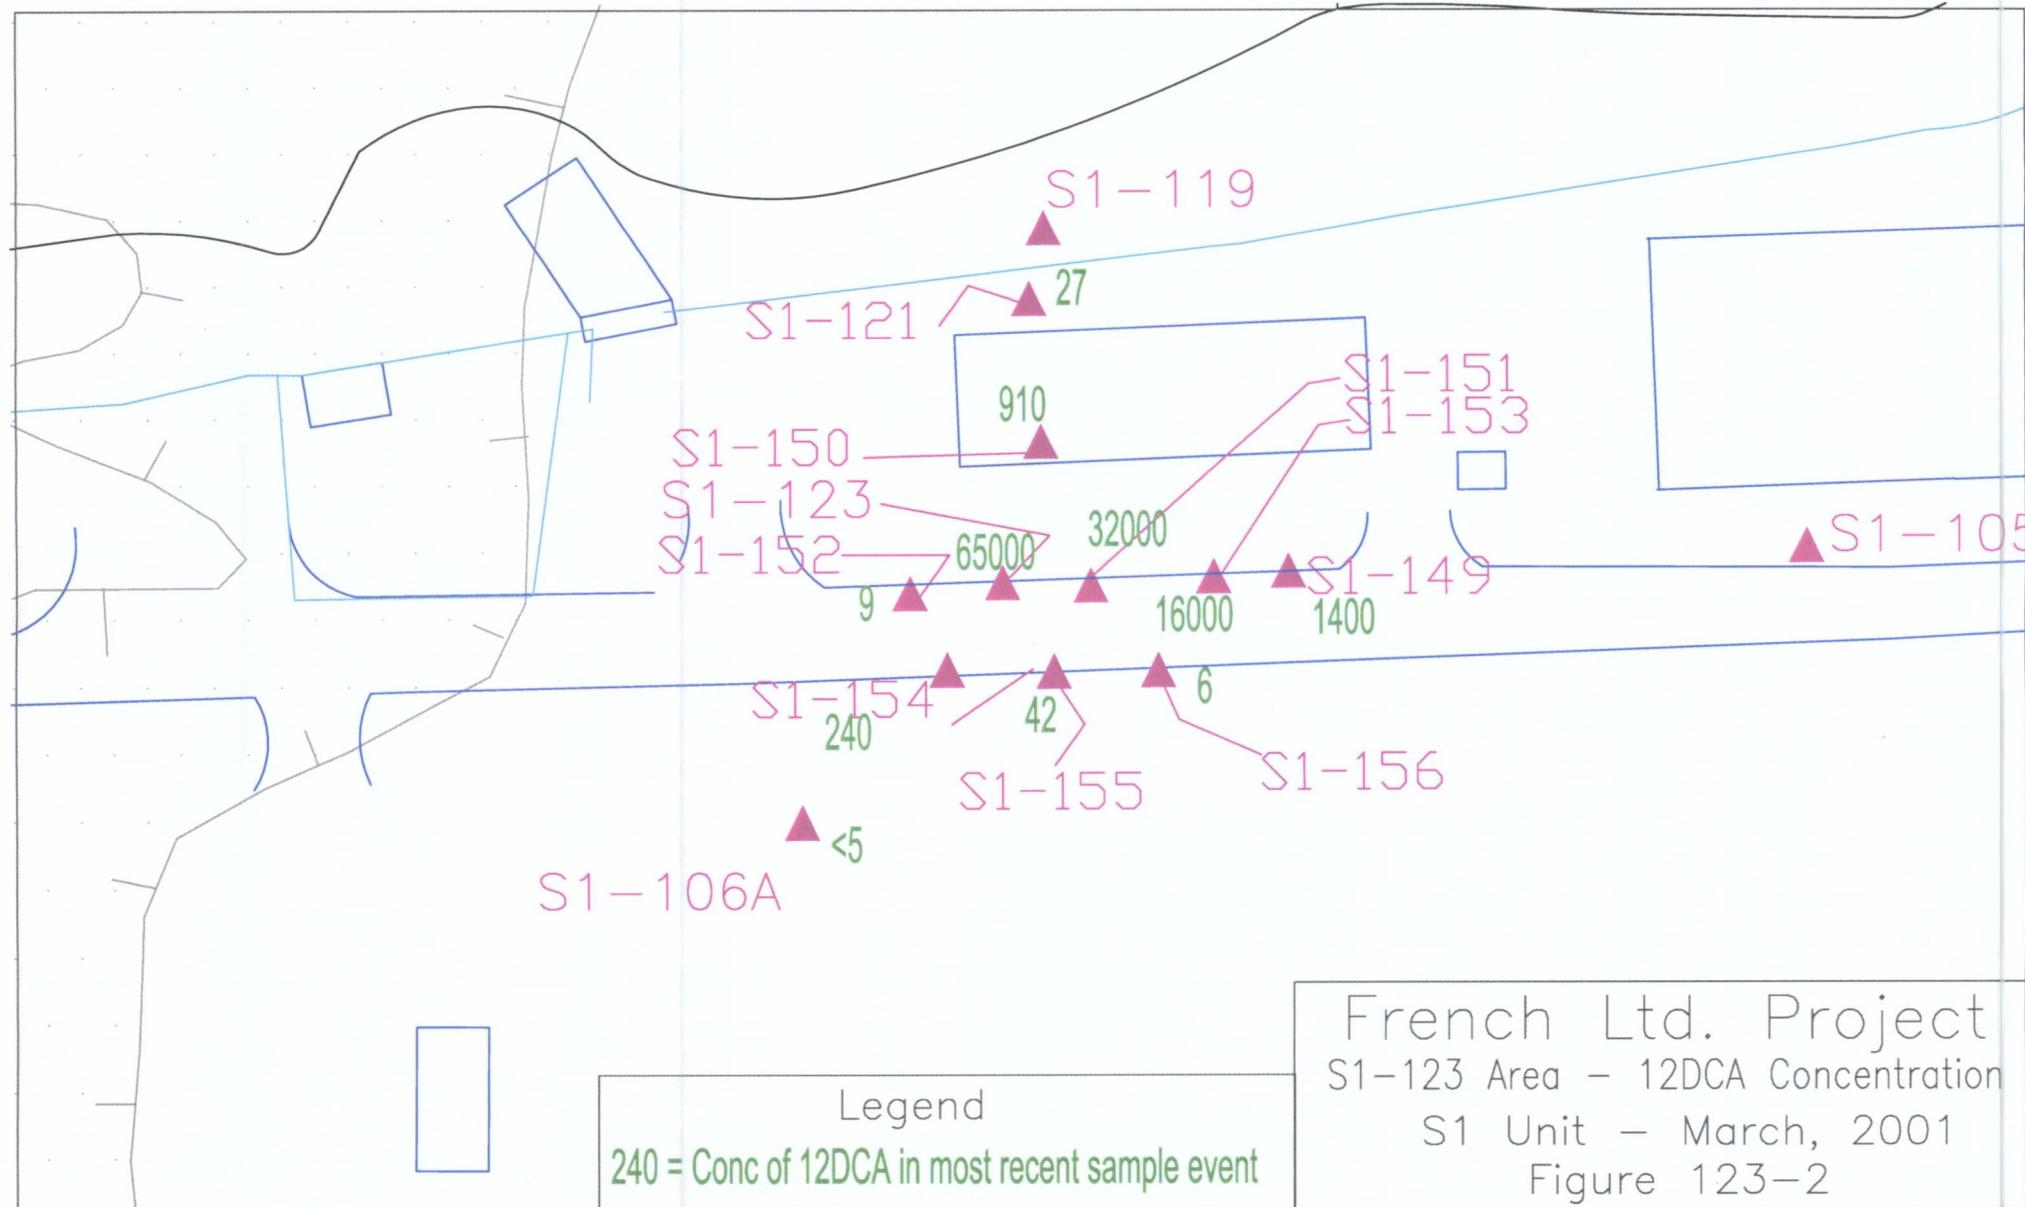

Total organic carbon contour maps for February, 2001, are presented in Figures 2-10 and 2-11. TOC concentrations are generally similar to the previous 6 months in both the S1 and INT units.

2.4.5 Benzene

Benzene contour maps for February, 2001, are presented in Appendix B. Benzene concentrations are generally similar to the previous 6 months in both S1 and INT units. There were no significant changes in benzene concentrations over the last 6 months; there is no indication of rebound.

2.4.6 1,2-DCA

1,2-DCA contour maps for February, 2001, are presented in Appendix B. 1,2-DCA concentrations are generally similar to the previous 6 months in both the S1 and INT units. The concentration remains elevated at S1-123, but there have been no increases in adjacent wells. Eight S1 wells were installed in the vicinity of S1-123 to define the extent of the 1,2-DCA; the localized 1,2-DCA plume in the vicinity of S1-123 is shown in Figure 123-2; the elevated S1 concentrations of 1,2-DCA appear to be limited to the S1-123 area. Seven INT wells were installed in the S1-123/INT-130R area to define the extent of 1,2-DCA.

2.4.7 Vinyl Chloride

Vinyl chloride contour maps for February, 2001, are presented in Appendix B. Vinyl chloride concentrations are generally similar to the previous 6 months in both the S1 and INT units. There does appear to be some attenuation in the southwest INT plume extension.

2.4.8 Carbon Tetrachloride

An INT carbon tetrachloride plume contour map for the INT-130R/RS area is presented in Figure 123-1. Carbon tetrachloride concentrations in INT-103R, INT-130RS, and INT-106 are generally similar to previous results.

2.4.9 Affected Groundwater

The affected areas in February, 2001, have not changed significantly over the last 6 months. The affected S1 and INT groundwater does not represent a threat to the public health or the environment, because FLTG controls all property that contains elevated concentrations of chemicals in groundwater, and all areas containing affected groundwater are potentially subject to institutional controls.

However, the very limited groundwater movement, the absence of natural attenuation trends in some areas, and the elevated VOC's at S1-123 and INT-130R/RS, indicate that natural attenuation trends need to be closely evaluated over the next several years.

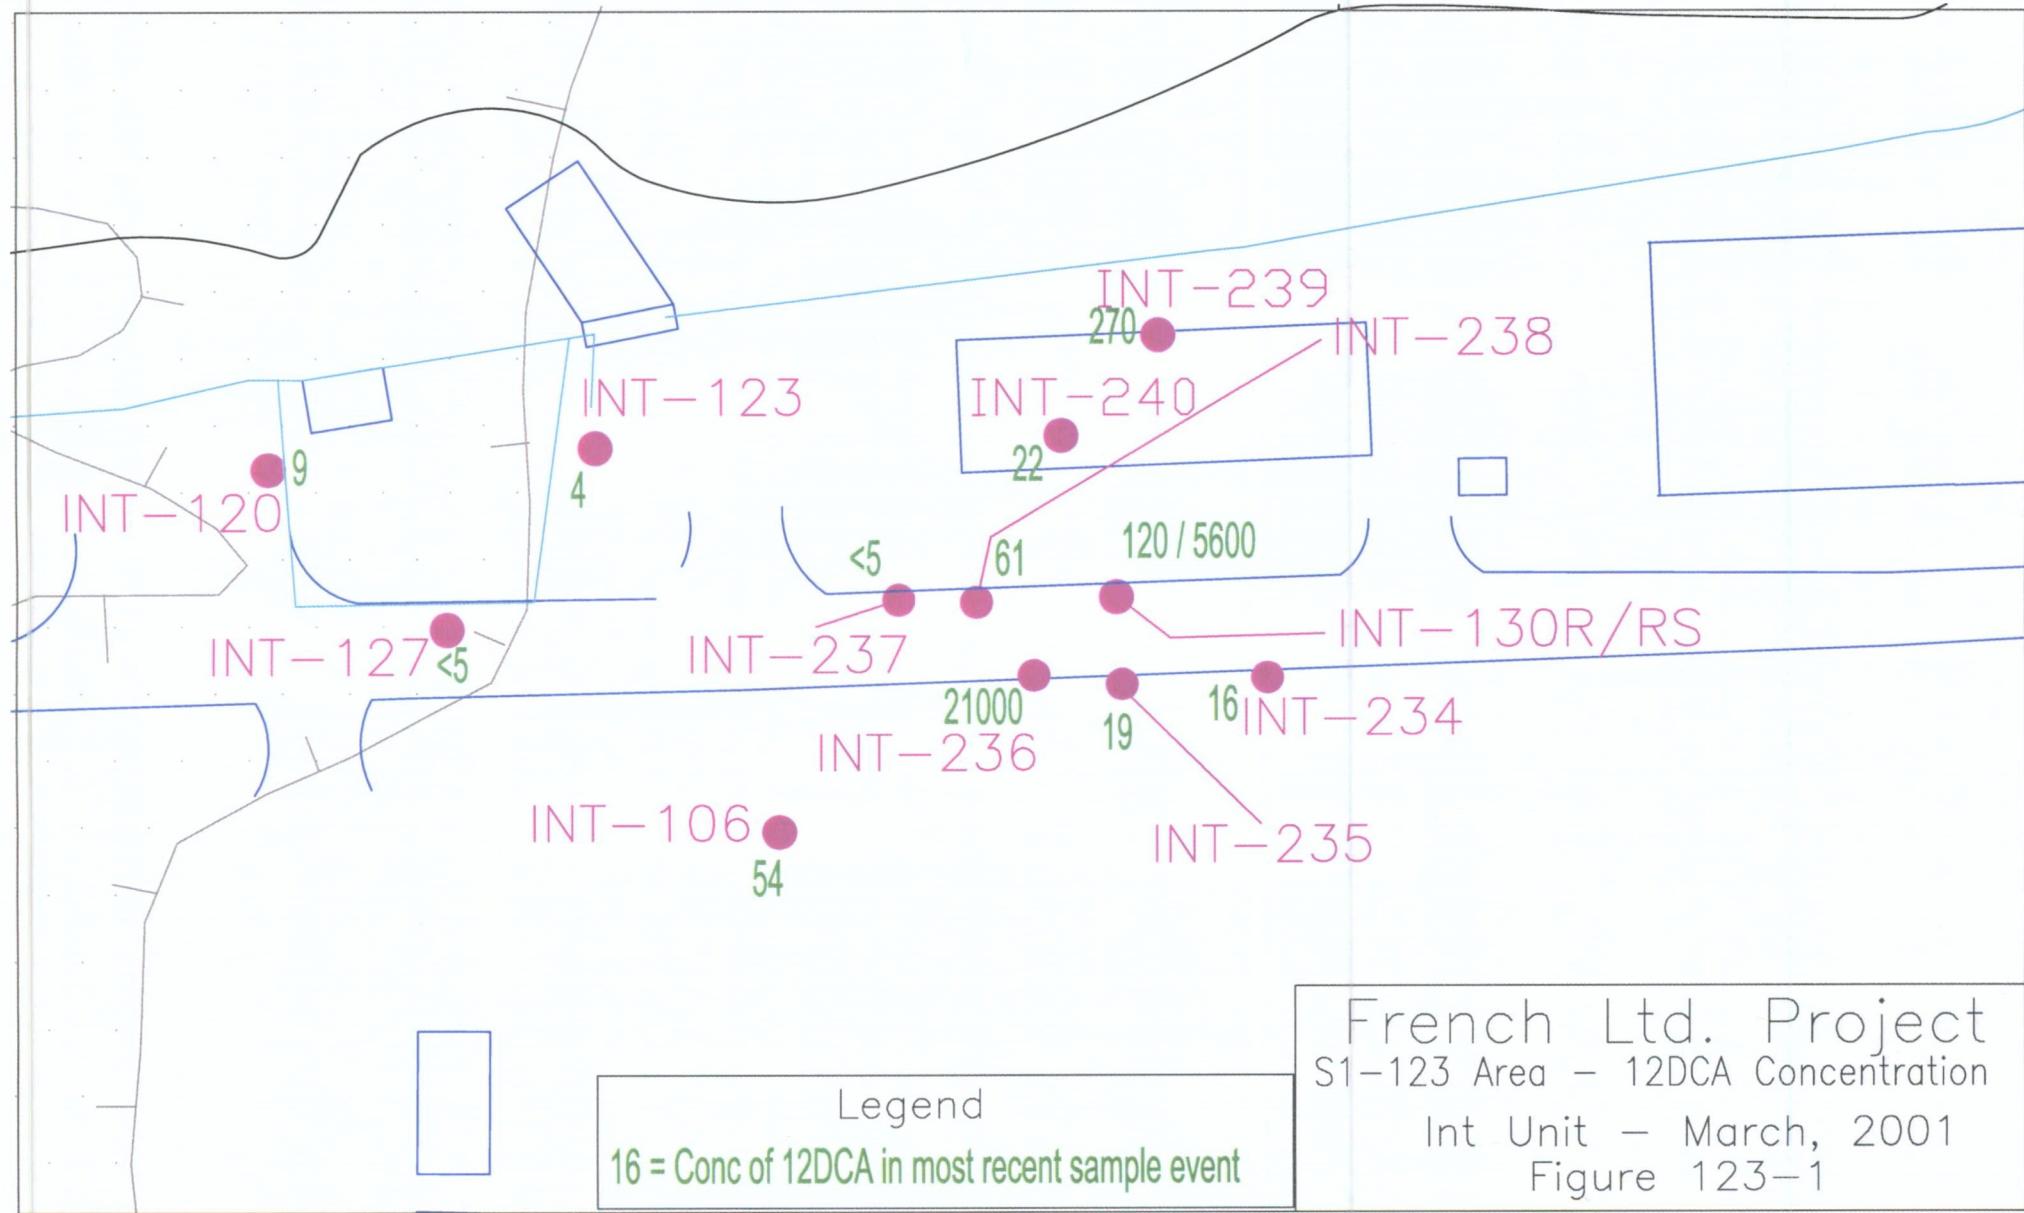

2.5 Five Year Sampling

The site monitoring plan calls for regular monitoring of certain groundwater wells for volatile organic chemicals, which are the "target" chemicals at the site. However, once every five years, the available groundwater monitoring wells are sampled and analyzed for:

- Volatile organics
- Semi-volatile organics
- Metals
- Pesticides
- PCB's

The objective of the broad analytical list once every five years is to determine if any substances should be considered for inclusion on the "regular" analytical list.

The results of the July, 2000, "broad" analytical effort are included in Appendix A; the results do not indicate any significant changes from the previous "broad" analytical effort. However, several wells did show slightly elevated pesticide levels; these wells were re-analyzed for pesticides in February, 2001. Section 1.3 of Appendix A discusses the follow-up pesticide sampling and the results. There were no pesticide levels above MCL's. Pesticide levels will be checked every five years.

3.0 MODELING UPDATE

The low migration rates and the generally stable chemical concentrations are consistent with the model. The plumes are elongating to the southwest consistent with the natural gradients. The public health continues to be protected. Actual field data over the next 2-3 years will confirm the original model.

4.0 CONCLUSIONS

There have been no significant changes in the physical or chemical groundwater trends. There is no evidence of chemical "rebound" in any areas. The S1 and INT zones immediately downgradient of the cutoff wall show stagnant flow conditions. The INT plume to the southwest is attenuating consistent with the local gradient. The S1-123 area may require future focused action to address the elevated 1,2-DCA and other chlorinateds; the INT-130R/RS area may require future focused action to address the elevated chloroform and other chlorinateds.

5.0 ACTION PLAN

**Measure water levels and sample wells twice per year. Maintain site and well security.
Evaluate response options for S1-123 area and for INT-130R/RS.**

Appendix A

February, 2001, Semi-Annual Groundwater Monitoring Event Analytical Results

Remedial Operations Group, Inc.

TO: Dick Sloan
FROM: Ron Jansen
CC: Jim Thomson
DATE: April 2, 2001
RE: French Ltd. Project - Semi-annual Groundwater Monitoring

Attached are the analytical results for the February 2001 semi-annual ground water monitoring event at the French Limited Site in Crosby, Texas. All wells were sampled using a 'hybrid' well purge method that combines the low-flow (micro-purge) method of sample collection with a pre-purge using a variable

1.0 Sampling Summary

A total of thirty-four (34) groundwater monitoring wells were sampled on February 6, 7, 8, 9, 12, 13, 14, and 15, 2001. All samples were analyzed by American Analytical and Technical Services - Baton Rouge (AATS-BR) and the Remedial Operations Group Lab at the Turtle Bayou Project. All samples were submitted to the lab under properly executed chain-of-custody documents. A sample collection summary is presented in Table 1. Table 2 lists the field QC samples with complete field duplicate precision reports in Attachment C. An analysis description and methodology summary is presented in Table 3.

Summary of Requested Analyses

Parameter	Analysis Description	Method
VOA	Volatile organics Target compound list	SW846 - 8260
Pesticides/PCBs	Pesticides/PCBs - Priority Pollutant list	SW846 - 8080
Metals	Arsenic, Chromium, Lead	EPA 200.7 / SW 6010
TOC	Total Organic Carbon	EPA 415.1
Nutrients	Potassium	EPA 200.7 / SW 6010
	Ammonia as N	EPA 350.3
	Nitrate as N	EPA 353.2
	Orthophosphate (P)	EPA 365.2

1.1 Analytical Data Validation

All analytical data was validated manually for these samples. Table 4 outlines the QC checks made on this data as applicable to the analytical method. All analytical data met QA/QC requirements with the exception of those listed in Table 5. Field duplicate analytical summaries, field and trip blank analytical summaries and MS/MSD

Remedial Operations Group, Inc.

analytical summaries are presented in Attachment C. A summary of field duplicate precision results is presented in Table 6.

TABLE 4
QA/QC Validation Check Summary

Validation Check
Holding Time - Method stated time between date sampled and date of extraction or analysis.
Method Sequence - Method stated sequence of analyses for instrument calibration and duration of sample analysis time after compliant calibration.
Initial Calibration (%RSD & RRF) - Percent relative standard deviation (%RSD): Verifies linearity over the stated calibration range - method specific. Relative response factor (RRF): Criteria ensures adequate instrument sensitivity for method specified analytes.
Continuing Calibration (%D) - Method stated percent difference range for calibration verification
Internal Standard Response(where applicable) - A measure of instrument stability
Surrogate Recovery - Surrogate compounds are added to the analysis procedure at a known concentration to verify method effectiveness. Surrogate recoveries are method specific ranges used to qualify analytical results.
Method Blank and Trip Blank Cleanliness - Laboratory prepared sample to verify sampling and analytical procedures in a clean matrix
MS/MSD Recovery & Precision Data - Checks sampling, preparation and analysis accuracy and precision
Blind Field Duplicate(BFD) Precision - Checks sampling, preparation and analysis reproducibility

Table 5
QC Exception Summary - February 2001 Event

Problem	Comment
The lead concentration for well INT-101 increased from undetected for 19 of the last 20 sampling events to 130 ppb in this sampling event.	Based on historical results for lead at this site, this concentration is a probably an analytical anomaly and doesn't represent a true measure of the analyte. Further sampling and analysis of this well for lead is suggested.
More than half of the samples for Nitrate and Orthophosphate analysis in this sampling event were analyzed outside method specified holding times.	The analytical data for nutrients is primarily used for monitoring concentrations of electron acceptors throughout the affected areas. However, the lab was notified that exceedance of holding times is unacceptable.
The batch duplicate was outside QC limits for all samples collected on 02/12/01 and 02/13/01 and analyzed for potassium.	The analytical data for nutrients is primarily used for monitoring concentrations of electron acceptors throughout the affected areas. No corrective action required.
Several concentration values for pesticides were greater than 25% different between the 1 st and 2 nd column.	The data was flagged with an "P" qualifier to denote this QC exception.
Blank spikes for the batches of samples analyzed on 02/15/01, 02/20/01, 02/22/01, 02/27/01, 03/12/01, 03/13/01 had spike analytes outside % recovery QC limits.	No corrective action required.
The Trichloroethene spike in the MS and MSD pair was outside % recovery QC limits.	The % recovery was 60 % in both the MS and MSD. The RPD for this pair was within control limits.

Table 6
Field Duplicate QC Summary

Sample Name	Duplicate Name	Comments
INT-127	INT-127 Dup	Volatile organics: 1,1-dichloroethane and tetrachloroethene RPD exceeded QC precision criteria (22.2% and 40% respectively). The concentrations for these analytes were flagged with a "J" qualifier indicating that the compounds were detected below the detection limit. No corrective action required.
INT-134	INT-134 Dup	Total Organic Carbon analyses RPD exceeded QC precision criteria (23.4%). No corrective action required.

Remedial Operations Group, Inc.

Table 6
Field Duplicate QC Summary

Sample Name	Duplicate Name	Comments
S1-121	S1-121 Dup	All RPD were within QC limits (< 20%)

1.2 Submissions

All samples were analyzed using appropriate methods and analysis sequences for the requested parameters. There were no QC issues with respect to calibration or (where applicable) internal standard or surrogate compound responses. All laboratory control samples reported results within acceptance limits. All field duplicate samples were readily reproducible for all parameters requested. All samples met project QC criteria except for those listed in Table 5.

The QC issues presented in Table 5 do not adversely affect the data for its intended use.

Historical analytical data summaries for all compliance wells are presented in Attachment A. Full analytical data summaries for all requested parameters are presented in Attachment B.

1.3 Data Evaluation

Two wells, INT-026 and INT-130R, were sampled for three consecutive days during this sample event to confirm the detection of pesticides in the July, 2000 semi-annual sampling event. Analytical summaries for these samples and the samples collected during the July, 2000 event are submitted in Attachment D. Table 7 summarizes the data from the wells that had pesticides detected above the detection limit.

None of the samples analyzed for pesticides had detectable concentrations of analytes above the National Primary Drinking Water Standard MCLs. Additionally, the concentrations of pesticides in samples analyzed several times were relatively inconsistent in terms of precision (ability to generate detectable analytical values within a given relative percent difference range).

All analytical data was summarized and submitted to project consultants and management for review. All analytical data reports submitted by the laboratory were examined for completeness and validated prior to entering the data into the project database. Complete analytical packages from the lab are available for review upon request.
